

Canine Gastrointestinal Dual Nucleic Acid Detection Kit (CPV & CCoV)

Product Information

Product Overview

Nucleic Acid Detection Kits for Dogs

Description

Giardia and *Cryptosporidium* cause gastrointestinal illness in dogs, while *Trichomonas foetus* can lead to reproductive issues in both male and female dogs. These parasites are transmitted through contaminated water or feces and are typically diagnosed via fecal tests.

Giardia duodenalis causes diarrhea, vomiting, and weight loss in dogs. Transmission occurs via ingestion of contaminated sources.

Cryptosporidium spp. cause diarrhea and vomiting and can be transmitted zoonotically. *Trichomonas foetus* is a protozoan causing vaginitis, prostatitis, and infertility. It spreads through sexual contact or during birth and is diagnosed via fecal or cytological exams.

Size

4 tests/box

Applications

- For detection in anal swabs and fecal samples.
- Fecal samples should be briefly centrifuged to pellet debris.
- Suitable for qualitative detection of *Giardia* spp., *Cryptosporidium* spp., *T. foetus*, and canine β -actin DNA.

Assay time

<1h 30m

Technical Notes

Canine internal control: β -actin DNA
