

Goat Anti-Human Hemoglobin PAb, HRP-Conjugation

Cat. No. CPBTT30932GH Lot. No. (See product label)

SPECIFICATION

Species	Human
Source	Goat
Product Overview	Polyclonal Antibody to Hemoglobin(HRP), Involved in oxygen transport from the lung to the various peripheral tissues.
Antigen Description	Defects in HBA1/HBA2 may be a cause of Heinz body anemias. This is a form of non-spherocytic hemolytic anemia of Dacie type 1. The hemoglobin demonstrates heat lability. Heinz bodies are observed also with the Ivemark syndrome (asplenia with cardiovascular anomalies) and with glutathione peroxidase deficiency. The hallmark of alpha-thalassemia is an imbalance in globin-chain production in the adult HbA molecule. Due to the complete absence of alpha chains, the predominant fetal hemoglobin is a tetramer of gamma-chains (Bart hemoglobin) that has essentially no oxygen carrying capacity.
Immunogen	Human Hemoglobin.
Host animal	Goat
Cross reactivity	Human. Predicted to work with Rabbit, Dog, Chimpanzee, Rhesus monkey
Isotype	IgG
Conjugation	HRP

 45-1 Ramsey Road, Shirley, NY 11967, USA

Conjugation notes	Molar enzyme/antibody protein ratio is 4:1.
Application	ICC; ELISA; WB
Storage Buffer	Preservative: 0.01% Thimerosal (merthiolate); Constituents: 0.1M Sodium chloride, 50mM HEPES. pH 7.1
Positive control	recombinant human hemoglobin
Specificity	The antibody has been tested in ELISA and IEP with a Human Hemaglobin Calibrator/Standard but has yet to be tested against endogenous protein.
Tissue Specificity	Red blood cells.
Sequence similarities	Belongs to the globin family.
Post-translational modifications	The initiator Met is not cleaved in variant Thionville and is acetylated
Purity	Immunogen affinity purified
Purification notes	Antibody concentration was determined by extinction coefficient prior to conjugation: absorbance at 280 nm of 1.4 equals 1.0 mg of IgG.
Storage	Store at +4°C.
Background	<p>Introduction</p> <p>Hemoglobin (also spelled haemoglobin and abbreviated Hb or Hgb) is the iron-containing oxygen-transport metalloprotein in the red blood cells of all vertebrates (with the exception of the fish family Channichthyidae) as well as the tissues of some invertebrates. Hemoglobin in the blood carries oxygen from the respiratory organs (lungs or gills) to the rest of the body (i.e. the tissues) where it is released.</p>

Keywords

ere it releases the oxygen to burn nutrients to provide energy to power the functions of the organism, and collects the resultant carbon dioxide to bring it back to the respiratory organs to be dispensed from the organism.
