Description Human fibroblast growth factor receptor 3 (FGFR3) is a cell surface receptor belonging to the immunoglobulin superfamily and a transmembrane receptor tyrosine kinase (RTK) that belongs to the FGFR family. FGFR3 is also known as ACH, cluster of differentiation 333 (CD333), CEK2, HSGFR3EX, and JTK4. FGFR3 contains an extracellular domain with three immunoglobulin-like (Ig-like) subdomains (D1, D2 and D3), followed by a transmembrane, and an intracellular domain. Dimerization of FGFRs is necessary for activation and they can homodimerize and heterodimerize in both the presence and absence of ligand. FGFRs bind fibroblast growth factors (FGFs) leading to phosphorylation and triggering signaling cascades. FGFR3 is involved in diseases including achondroplasia, hypochondroplasia, and bladder cancer. Therefore, a recombinant protein mimicking the FGFR3 dimer conformation can be critical for cancer therapeutic discovery.
