

# Recombinant MERS-CoV S Protein (Glu366-Asn602), C-His tagged

Cat. No. S-5395M Lot. No. (See product label)

## SPECIFICATION

### Product Overview

Recombinant MERS-CoV S/Spike glycoprotein (Glu366-Asn 602) fused with the C-terminal His tag was expressed in Mammalian cells.

### Species

MERS-CoV

### Source

Mammalian Cells

### ProteinLength

Glu366-Asn602

### Description

Spike protein S1: attaches the virion to the cell membrane by interacting with host receptor, initiating the infection.

Spike protein S2: Acts as a viral fusion peptide which is unmasked following S2 cleavage occurring upon virus endocytosis.

Spike protein S2: mediates fusion of the virion and cellular membranes by acting as a class I viral fusion protein. Under the current model, the protein has at least three conformational states: pre-fusion native state, pre-hairpin intermediate state, and post-fusion hairpin state. During viral and target cell membrane fusion, the coiled coil regions (heptad repeats) assume a trimer-of-hairpins structure, positioning the fusion peptide in close proximity to the C-terminal region of the ectodomain. The formation of this structure appears to drive apposition and subsequent fusion of viral and target cell membranes.
