

Active Native Bovine alpha-Thrombin-DFP

Cat. No. Thrombin-28B **Lot. No.** (See product label)

SPECIFICATION

Product Overview Native Bovine alpha-Thrombin was purified from Plasma. DFP is thrombin blocked with DFP (Diisopropylfluorophosphate).

Species Bovine

Source Plasma

Description Alpha-thrombin is a highly specific serine protease generated by proteolytic activation of the zymogen prothrombin. During coagulation, thrombin cleaves fibrinogen to form fibrin, leading to the ultimate step in coagulation, the formation of a fibrin clot. Thrombin is also responsible for feedback activation of the procofactors factor V and factor VIII. Thrombin has also been reported to activate factor XIII and platelets, and also functions as a vasoconstrictor protein. The procoagulant activity of thrombin is arrested in two ways: 1) inhibition by either heparin cofactor II or the antithrombin III/heparin complex; or 2) complex formation with thrombomodulin. Formation of the thrombin/thrombomodulin complex results in the inability of thrombin to cleave fibrinogen and activate factors V and VIII, but increases the efficiency of thrombin for activation of the anticoagulant, protein C.

Form 20 mM Hepes, 150 mM NaCl, pH 7.4

Bio-activity approximately 3800 NIH units/mg

Molecular Mass 36700 Da

 Tel: 1-631-559-9269 1-516-512-3133
