

Recombinant Human STAR, His-tagged

Cat. No. STAR-30116TH **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant full length Human StAR with an N terminal His tag; 243aa, 27.1kDa.
Species	Human
Source	E.coli
ProteinLength	222 amino acids
Description	The protein encoded by this gene plays a key role in the acute regulation of steroid hormone synthesis by enhancing the conversion of cholesterol into pregnenolone. This protein permits the cleavage of cholesterol into pregnenolone by mediating the transport of cholesterol from the outer mitochondrial membrane to the inner mitochondrial membrane. Mutations in this gene are a cause of congenital lipoid adrenal hyperplasia (CLAH), also called lipoid CAH. A pseudogene of this gene is located on chromosome 13.
Conjugation	HIS
Molecular Weight	27.100kDa inclusive of tags
Tissue specificity	Expressed in gonads, adrenal cortex and kidney.
Form	Liquid
Purity	>90% by SDS-PAGE
