

Recombinant Human OGG1 Protein

Cat. No. OGG1-108H **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant Human OGG1(Met1-Gly345), transcript variant 1a, was expressed in E. coli.
Species	Human
Source	E.coli
ProteinLength	Met1-Gly345
Description	This gene encodes the enzyme responsible for the excision of 8-oxoguanine, a mutagenic base byproduct which occurs as a result of exposure to reactive oxygen. The action of this enzyme includes lyase activity for chain cleavage. Alternative splicing of the C-terminal region of this gene classifies splice variants into two major groups, type 1 and type 2, depending on the last exon of the sequence. Type 1 alternative splice variants end with exon 7 and type 2 end with exon 8. All variants share the N-terminal region in common, which contains a mitochondrial targeting signal that is essential for mitochondrial localization. Many alternative splice variants for this gene have been described, but the full-length nature for every variant has not been determined.
