

Recombinant Human IDH2 Protein, MYC/DDK-tagged

Cat. No. IDH2-045H **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant protein of human isocitrate dehydrogenase 2 (NADP+), mitochondrial (IDH2 mutant R172K), nuclear gene encoding mitochondrial protein, with C-terminal MYC/DDK tag, was expressed in human cells.
Species	Human
Source	HEK293
Description	Isocitrate dehydrogenases catalyze the oxidative decarboxylation of isocitrate to 2-oxoglutarate. These enzymes belong to two distinct subclasses, one of which utilizes NAD(+) as the electron acceptor and the other NADP(+). Five isocitrate dehydrogenases have been reported: three NAD(+)-dependent isocitrate dehydrogenases, which localize to the mitochondrial matrix, and two NADP(+)-dependent isocitrate dehydrogenases, one of which is mitochondrial and the other predominantly cytosolic. Each NADP(+)-dependent isozyme is a homodimer. The protein encoded by this gene is the NADP(+)-dependent isocitrate dehydrogenase found in the mitochondria. It plays a role in intermediary metabolism and energy production. This protein may tightly associate or interact with the pyruvate dehydrogenase complex. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Feb 2014].
