

Recombinant Human CFB Protein, His-Tagged

Cat. No. CFB-1161H Lot. No. (See product label)

SPECIFICATION

Product Overview	Human CFB full-length recombinant protein contains N-linked glycans of the short and simple man5-GlcNAc2 type with N-terminal hexahistidine tag expressed expressed in HEK293EBNA2 cells.
Species	Human
Source	HEK293
Description	This gene encodes complement factor B, a component of the alternative pathway of complement activation. Factor B circulates in the blood as a single chain polypeptide. Upon activation of the alternative pathway, it is cleaved by complement factor D yielding the noncatalytic chain Ba and the catalytic subunit Bb. The active subunit Bb is a serine protease which associates with C3b to form the alternative pathway C3 convertase. Bb is involved in the proliferation of preactivated B lymphocytes, while Ba inhibits their proliferation. This gene localizes to the major histocompatibility complex (MHC) class III region on chromosome 6. This cluster includes several genes involved in regulation of the immune reaction. Polymorphisms in this gene are associated with a reduced risk of age-related macular degeneration. The polyadenylation site of this gene is 421 bp from the 5' end of the gene for complement component 2. [provided by RefSeq, Jul 2008]
