

Recombinant Mouse Ephx2 Protein, His-tagged

Cat. No. Ephx2-36M **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant mouse Ephx2 protein with a N-terminal His-tag was expressed in Sf21 cells.
Species	Mouse
Source	Insect Cells
Description	Mammalian soluble epoxide hydrolase (sEH) is a member of the α/β -hydrolase fold family of enzymes that catalyzes the hydrolysis of exogenous and endogenous epoxides to vicinal diols. sEH is a homodimer consisting of two domains. The C-terminal domain is responsible for the epoxide hydrolase activity while the N-terminal domain has a catalytic center with phosphatase activity. Endogenous substrates for sEH include epoxyeicosatrienoic acids (EETs) which are known for their vasodilatory effects as well as for their anti-inflammatory actions. Inhibition of sEH in animal models was shown to reduce hypertension and vascular inflammation, as well as related syndromes, validating sEH as a highly promising target for drug discovery.
