

Recombinant Human GNMT Protein, Myc/DDK-tagged, C13 and N15-labeled

Cat. No. GNMT-535H **Lot. No.** (See product label)

SPECIFICATION

Product Overview	GNMT MS Standard C13 and N15-labeled recombinant protein (NP_061833) with a C-terminal MYC/DDK tag, was expressed in HEK293 cells.
Species	Human
Source	HEK293
Description	The protein encoded by this gene is an enzyme that catalyzes the conversion of S-adenosyl-L-methionine (along with glycine) to S-adenosyl-L-homocysteine and sarcosine. This protein is found in the cytoplasm and acts as a homotetramer. Defects in this gene are a cause of GNMT deficiency (hypermethioninemia). Alternative splicing results in multiple transcript variants. Naturally occurring readthrough transcription occurs between the upstream CNPY3 (canopy FGF signaling regulator 3) gene and this gene and is represented with GeneID:107080644.
