

Recombinant Human GFER Protein, Myc/DDK-tagged, C13 and N15-labeled

Cat. No. GFER-1412H **Lot. No.** (See product label)

SPECIFICATION

Product Overview	GFER MS Standard C13 and N15-labeled recombinant protein (NP_005253) with a C-terminal MYC/DDK tag, was expressed in HEK293 cells.
Species	Human
Source	HEK293
Description	The hepatotrophic factor designated augments of liver regeneration (ALR) is thought to be one of the factors responsible for the extraordinary regenerative capacity of mammalian liver. It has also been called hepatic regenerative stimulation substance (HSS). The gene resides on chromosome 16 in the interval containing the locus for polycystic kidney disease (PKD1). The putative gene product is 42% similar to the scERV1 protein of yeast. The yeast scERV1 gene had been found to be essential for oxidative phosphorylation, the maintenance of mitochondrial genomes, and the cell division cycle. The human gene is both the structural and functional homolog of the yeast scERV1 gene.
