

Recombinant Human ODAD4 Protein, Myc/DDK-tagged, C13 and N15-labeled

Cat. No. ODAD4-3198H **Lot. No.** (See product label)

SPECIFICATION

Product Overview	TTC25 MS Standard C13 and N15-labeled recombinant protein (NP_113609) with a C-terminal MYC/DDK tag, was expressed in HEK293 cells.
Species	Human
Source	HEK293
Description	This gene encodes a tetratricopeptide repeat domain-containing protein that localizes to ciliary axonemes and plays a role in the docking of the outer dynein arm to cilia. Mutations in this gene cause severely reduced ciliary motility and the disorder CILD35 (ciliary dyskinesia, primary, 35). Primary ciliary dyskinesia is often associated with recurrent respiratory infections, immotile spermatozoa, and situs inversus; an inversion in left-right body symmetry. Alternative splicing results in multiple transcript variants encoding distinct isoforms.
