

Recombinant Human MAGED2 Protein, Myc/DDK-tagged, C13 and N15-labeled

Cat. No. MAGED2-6130H **Lot. No.** (See product label)

SPECIFICATION

Product Overview	MAGED2 MS Standard C13 and N15-labeled recombinant protein (NP_055414) with a C-terminal MYC/DDK tag, was expressed in HEK293 cells.
Species	Human
Source	HEK293
Description	This gene is a member of the MAGED gene family. The MAGED genes are clustered on chromosome Xp11. This gene is located in Xp11.2, a hot spot for X-linked intellectual disability (XLID). Mutations in this gene cause a form of transient antenatal Bartter's syndrome. This gene may also be involved in several types of cancer, including breast cancer and melanoma. The protein encoded by this gene is progressively recruited from the cytoplasm to the nucleoplasm during the interphase and after nucleolar stress and is thus thought to play a role in cell cycle regulation. Alternative splicing results in multiple transcript variants.
