

Recombinant Full Length Human NFkB1 Protein

Cat. No. NFkB1-343HF **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant full length protein of Human NFkB p105 / p50 with proprietary tag; predicted MW 132.66 kDa, inclusive of tag.
Species	Human
Source	In Vitro Cell Free System
ProteinLength	968 amino acids
Description	This gene encodes a 105 kD protein which can undergo cotranslational processing by the 26S proteasome to produce a 50 kD protein. The 105 kD protein is a Rel protein-specific transcription inhibitor and the 50 kD protein is a DNA binding subunit of the NF-kappa-B (NFkB) protein complex. NFkB is a transcription regulator that is activated by various intra- and extra-cellular stimuli such as cytokines, oxidant-free radicals, ultraviolet irradiation, and bacterial or viral products. Activated NFkB translocates into the nucleus and stimulates the expression of genes involved in a wide variety of biological functions. Inappropriate activation of NFkB has been associated with a number of inflammatory diseases while persistent inhibition of NFkB leads to inappropriate immune cell development or delayed cell growth. Two transcript variants encoding different isoforms have been found for this gene.
