

Active Recombinant Mouse IL23r, His-tagged

Cat. No. IL23r-5658M **Lot. No.** (See product label)

SPECIFICATION

Product Overview	A DNA sequence encoding the mouse IL23A (Q9EQ14) (Met1-Ala196) was fused with a polyhistidine tag at the C-terminus, constructed the plasmid 1; A DNA sequence encoding mouse IL12B (P43432) (Met1-Ser335) was fused with a polyhistidine tag at the C-terminus, constructed the plasmid 2. The two plasmids were co-expressed and the mouse IL23 heterodimer was purified.

Description	Interleukin-23 subunit alpha, also known as IL-23 subunit alpha, IL-23-A, Interleukin-23 subunit p19, IL-23p19 and IL23A, is a secreted protein which belongs to the IL-6 superfamily. IL-23A associates with IL12B to form the IL-23 interleukin, an heterodimeric cytokine which functions in innate and adaptive immunity. IL-23 may constitute with IL-17 an acute response to infection in peripheral tissues. IL-23 binds to an heterodimeric receptor complex composed of IL12RB1 and IL23R, activates the Jak-Stat signaling cascade, stimulates memory rather than naive T-cells and promotes production of proinflammatory cytokines. IL-23 induces autoimmune inflammation and may be responsible for autoimmune inflammatory diseases and may be important for tumorigenesis. Interleukin-12 subunit beta, also known as cytotoxic lymphocyte maturation factor 40 kDa subunit, NK cell stimulatory factor chain 2, NKSF2 and IL12B, is secreted protein which belongs to the type I cytokine

receptor family and Type 3 subfamily. IL12B / NKSF2 is a cytokine that can act as a growth factor for activated T and NK cells, enhance the lytic activity of NK/lymphokine-activated killer cells, and stimulate the production of IFN-gamma by resting PBMC. IL12B / NKSF2 associates with IL-23A to form the IL-23 interleukin, an heterodimeric cytokine which functions in innate and adaptive immunity. IL-23 may constitute with IL-17 an acute response to infection in peripheral tissues.
