

Recombinant Human NRP1 Protein, His-tagged

Cat. No. NRP1-396H **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant human NRP1 protein with His tag was expressed in HEK293.
Species	Human
Source	HEK293
ProteinLength	923
Description	This gene encodes one of two neuropilins, which contain specific protein domains which allow them to participate in several different types of signaling pathways that control cell migration. Neuropilins contain a large N-terminal extracellular domain, made up of complement-binding, coagulation factor V/VIII, and meprin domains. These proteins also contains a short membrane-spanning domain and a small cytoplasmic domain. Neuropilins bind many ligands and various types of co-receptors; they affect cell survival, migration, and attraction. Some of the ligands and co-receptors bound by neuropilins are vascular endothelial growth factor (VEGF) and semaphorin family members. This protein has also been determined to act as a co-receptor for SARS-CoV-2 (which causes COVID-19) to infect host cells.
