

Recombinant Human FGΓ Protein (27-437aa), N-His tagged

Cat. No. FGG-01H **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant human FGΓ (27-437aa), fused to His-tag at N-terminus, was expressed in E. coli and purified by using conventional chromatography techniques.
Species	Human
Source	E.coli
ProteinLength	27-437aa
Description	The protein encoded by this gene is the gamma component of fibrinogen, a blood-borne glycoprotein comprised of three pairs of nonidentical polypeptide chains. Following vascular injury, fibrinogen is cleaved by thrombin to form fibrin which is the most abundant component of blood clots. In addition, various cleavage products of fibrinogen and fibrin regulate cell adhesion and spreading, display vasoconstrictor and chemotactic activities, and are mitogens for several cell types. Mutations in this gene lead to several disorders, including dysfibrinogenemia, hypofibrinogenemia and thrombophilia. Alternative splicing results in transcript variants encoding different isoforms.
Form	Liquid
Molecular Mass	48.9 kDa (434aa) confirmed by MALDI-TOF
