Cat. No. S-5396M **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant MERS-CoV S/Spike glycoprotein (RBD) (Glu11-Leu220) without tag was expressed in Mammalian cells.
Species	MERS-CoV
Source	Mammalian Cells
ProteinLength	Glu11-Leu220
Description	Spike protein S1: attaches the virion to the cell membrane by interacting with host receptor, initiating the infection. Spike protein S2: Acts as a viral fusion peptide which is unmasked following S2 cleavage occurring upon virus endocytosis. Spike protein S2: mediates fusion of the virion and cellular membranes by acting as a class I viral fusion protein. Under the current model, the protein has at least three conformational states: pre-fusion native state, pre-hairpin intermediate state, and post-fusion hairpin state. During viral and target cell membrane fusion, the coiled coil regions (heptad repeats) assume a trimer-of-hairpins structure, positioning the fusion peptide in close proximity to the C-terminal region of the ectodomain. The formation of this structure appears to drive apposition and subsequent fusion of viral and target cell membranes.
