

Ni-TED PMMA resin

Cat. No. Ni-TED-001M **Lot. No.** (See product label)

SPECIFICATION

Product Overview

The principle of metal chelate affinity chromatography is to use transition metal ions such as Ni²⁺, Cu²⁺, Zn²⁺, Co²⁺ to coordinate with histidine, tryptophan, or cysteine on the protein surface. Due to the different types, quantities, positions and spatial conformations of these amino acids on the protein surface, the affinity forces with metal chelates are different. The purification process can be completed efficiently. The metal chelating affinity chromatography medium produced by Nanwei Technology with its own patented technology can meet the capture requirements in the downstream separation and purification process of bioengineering. Nano metal chelating affinity chromatography was prepared by covering the surface of highly crosslinked polyacrylate microspheres with a hydrophilic film, and then by coupling the chelating groups. The hydrophilic film layer completely covers the surface of the microsphere, which can minimize the non-specific adsorption between the fixed phase and the biomolecules, and improve the recovery rate of the separated substances. The series of products have the characteristics of uniform particle size, low non-specific adsorption and good physicochemical stability, and can be widely used in the capture of label proteins.

Matrix	Polymethyl acrylate (PMMA)
Average particle size	80 μm
Ligand	TED
Max Pressure	0.5 Mpa

 Tel: 1-631-559-9269 1-516-512-3133

 Email: info@creative-biomart.com  Fax: 1-631-938-8127

 45-1 Ramsey Road, Shirley, NY 11967, USA

pH stability range	2-12
CIP in-place cleaning	0.5 M NaOH
Recommended flow rate	150-750
Operating Temperature	4-30°C
Chemical stability	Stabilized aqueous solution, 0.1M HCl, 0.1MNaOH, 2% SDS, 30% isopropyl alcohol, 6M guanidine hydrochloride, 8M urea, 70% ethanol (under Ni removal condition).
Storage	Store at 20% ethanol, 4-25°C.
