Cat. No. BMP4-125H Lot. No. (See product label)

SPECIFICATION

Product Overview	Disulfidelinked homodimerMouse myeloma cell line, NS0derivedSer293-Arg408Accession # Q53XC5Manufactured and tested under current Good Manufacturing Practice (GMP) guidelines.
Species	Human
Source	NS0
Description	BMPs are secreted signaling molecules that comprise a subfamily of the TGF-beta superfamily and were originally identified as regulators of cartilage and bone formation. There are at least 20 structurally and functionally related BMPs, most of which play roles in embryogenesis and morphogenesis of various tissues and organs. Biologically active BMPs are usually homodimers containing a characteristic cysteine knot structure. Heterodimers, BMP-2/BMP-7 and BMP-4/BMP-7 have also been suggested to exist and function in vivo. They are more potent inducers of bone formation than their respective homodimers. In addition, heterodimers, but not homodimers, are ventral mesoderm inducers. Heterodimer activity may be mediated by a different or additional receptor subtype.
Predicted N Terminal	Ser293-Pro-Lys-His-His-Ser-Gln-Arg-Ala-Arg
Form	Lyophilized from a 0.2 µm filtered solution in Acetonitrile and TFA.
Bio-activity	Measured by its ability to induce alkaline phosphatase production by ATDC5 mouse chondrogenic cells. Binnerts, M.E. et al. (2004) Biochem. Biophys. Res. Commun.
