

Recombinant Human Von Hippel-Lindau Tumor Suppressor

Cat. No. VHL-232H **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant Human VHL b -domain produced in <i>E. Coli</i> is a single, non-glycosylated polypeptide chain. The protein contains 174 amino acids and has a molecular mass of 19.2 kDa.
Species	Human
Source	E.coli
Description	Von Hippel-Lindau disease (VHL) is a dominant inherited syndrome characterized by the predisposition to develop various kinds of benign and malignant tumors, including clear cell renal carcinomas, pheochromocytomas and hemangioblastomas of the central nervous system and retina. VHL syndrome is caused by germline mutation in the VHL tumor suppressor, and VHL tumors are associated with loss or mutation of the remaining wild-type allele. VHL has two domains: a roughly 100-residue NH2-terminal domain rich in β sheet (b-domain) and a smaller α -helical domain (α -domain), held together by two linkers and a polar interface. VHL protein is also involved in the degradation of hypoxia-inducible factor (HIF).
