

Recombinant Influenza B virus Nucleoprotein

Cat. No. NP-12V **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant Influenza B virus Nucleoprotein (NP), partial, 1-245 aa
Species	Influenza B virus (strain B/Ann Arbor/1/1966 [wild-type])
Source	E.Coli/Yeast/Baculovirus/Mammalian Cell
ProteinLength	1-245 aa
Description	Encapsidates the negative strand viral RNA, protecting it from nucleases. The encapsidated genomic RNA is termed the ribonucleoprotein (RNP) and serves as template for transcription and replication. The RNP needs to be localized in the host nucleus to start an infectious cycle, but is too large to diffuse through the nuclear pore complex. NP comprises at least 2 nuclear localization signals that are responsible for the active RNP import into the nucleus through cellular importin alpha/beta pathway. Later in the infection, nuclear export of RNPs are mediated through viral proteins NEP interacting with M1 which binds nucleoproteins. It is possible that nucleoprotein binds directly host exportin-1/XPO1 and plays an active role in RNPs nuclear export. M1 interaction with RNP seems to hide nucleoprotein's nuclear localization signals. Soon after a virion infects a new cell, M1 dissociates from the RNP under acidification of the virion driven by M2 protein. Dissociation of M1 from RNP unmask nucleoprotein's nuclear localization signals, targeting the RNP to the nucleus.
Tag	This protein contains an N-terminal tag and may also contain a C-terminal tag.
Form	Lyophilized or liquid
