Description	Bromodomain and WD repeat domain containing 1 (BRWD1), also known as WDR9 is a member of the WD repeat protein family. WD repeats are minimally conserved regions of approximately 40 amino acids typically bracketed by gly-his and trp-aspartate (GH-WD) residues which may facilitate formation of heterotrimeric or multiprotein complexes. Members of this family are involved in a variety of cellular processes including cell cycle progression, signal transduction, apoptosis, and gene regulation. This protein contains 2 bromodomains and multiple WD repeats. The bromodomain functions as a "reader" of epigenetic histone marks and regulates chromatin structure and gene expression by linking associated proteins to the recognized acetylated nucleosomal targets. In mouse, this BRWD1 is a nuclear protein that has a polyglutamine-containing region that functions as a transcriptional activation domain. This domain associates with a component of the SWI/SNF chromatin remodeling complex and may function to regulate chromatin remodeling. BRWD1 plays a role in the regulation of cell morphology and cytoskeletal organization and is also required in
