

Recombinant Human PLAT therapeutic protein(Retepase)

Cat. No. PLAT-P033H **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant Human tissue plasminogen activator is genetically engineered to retain and delete certain portions of human tPA. The protein is a deletion mutein of human tPA formed by deleting various amino acids present in endogenous human tPA. It contains 355 of the 527 amino acids of native human tPA (amino acids 1-3 and 176-527), and retains the activity-related kringle-2 and serine protease domains of human tPA. Three domains are deleted from retavase – kringle-1, finger, and epidermal growth factor (EGF).

Description	This gene encodes tissue-type plasminogen activator, a secreted serine protease which converts the proenzyme plasminogen to plasmin, a fibrinolytic enzyme. Tissue-type plasminogen activator is synthesized as a single chain which is cleaved by plasmin to a two chain disulfide linked protein. This enzyme plays a role in cell migration and tissue remodeling. Increased enzymatic activity causes hyperfibrinolysis, which manifests as excessive bleeding; decreased activity leads to hypofibrinolysis which can result in thrombosis or embolism. Alternative splicing of this gene results in multiple transcript variants encoding different isoforms. The expression product is the active ingredient of Retavase and Activase.
