

Recombinant Human DNASE1 therapeutic protein(Dornase alfa)

Cat. No. DNASE1-P001H **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Recombinant Human Deoxyribonuclease I therapeutic protein is a biosynthetic form of human deoxyribonuclease I (DNase I) enzyme. It is produced in genetically modified Chinese hamster ovary (CHO) cells using recombinant DNA technology. The 260-amino acid sequence of dornase alfa is identical to the endogenous human enzyme.

Description	This gene encodes a member of the DNase family. This protein is stored in the zymogen granules of the nuclear envelope and functions by cleaving DNA in an endonucleolytic manner. At least six autosomal codominant alleles have been characterized, DNASE1*1 through DNASE1*6, and the sequence of DNASE1*2 represented in this record. Mutations in this gene have been associated with systemic lupus erythematosus (SLE), an autoimmune disease. A recombinant form of this protein is used to treat the one of the symptoms of cystic fibrosis by hydrolyzing the extracellular DNA in sputum and reducing its viscosity. Alternate transcriptional splice variants of this gene have been observed but have not been thoroughly characterized. The expression product is the active ingredient of Pulmozyme and Viscozyme.
