

Native Human FTH1

Cat. No. FTH1-28155TH **Lot. No.** (See product label)

SPECIFICATION

Product Overview	Full length native Human Ferritin from Human spleen. MWt 450kDa consisting of 24 subunits, light chain 199 kDa, heavy chain 210 kDa. Amino acids 174 , 183.
Species	Human
Description	This gene encodes the heavy subunit of ferritin, the major intracellular iron storage protein in prokaryotes and eukaryotes. It is composed of 24 subunits of the heavy and light ferritin chains. Variation in ferritin subunit composition may affect the rates of iron uptake and release in different tissues. A major function of ferritin is the storage of iron in a soluble and nontoxic state. Defects in ferritin proteins are associated with several neurodegenerative diseases. This gene has multiple pseudogenes. Several alternatively spliced transcript variants have been observed, but their biological validity has not been determined.
Molecular Weight	450.000kDa
